*ISO 9001*  
Cert JQA 1248

JAPAN QUALITY ASSURANCE ORGANIZATION

THE INTERNATIONAL CERTIFICATION NETWORK

OCM chains are used in various equipment. The company was founded in 1947 to manufacture chains. Since then OCM has been engaged in the manufacture of roller chains, conveyors and sprockets. OCM is, therefore, in a position to meet customer's requirements with broad experience and endless research.

For over 58 years OCM's effort has been to solve the problems of industry. OCM S10 the world's smallest chain and OSB Series OCM has first manufactured indicate its ability.

OCM's dedication is to provide products that help solve the problems of industry in the world.

# I N D E X

Warning	4
Cutting and Connecting of Chain	80
OCM Roller Chain Dimensions	5
Features of OCM Roller Chain	6
Construction of Roller Chain	7
Chain Drive Selection	8 - 13
Lubrication	14

## Roller Chain

OSB Series Roller Chain ANSI 40 to 240	15 - 16
ANSI Roller Chain 25 to 240	17 - 30
ANSI Heavy Series 35H to 200H	31
Double Pitch Roller Chain 2040 to 2080	32

## Self Lubricating Chain

Self Lubricating Chain	33
Self Lube ANSI 35 to 120 and C2040 to C2082H	34 - 35
Self Lube Attachment 35 to 80 and C2040 to C2082H	36 - 37

## Extra Heavy Duty Chain

Extra Heavy Duty Chain	38
Extra Heavy Duty HS Series HS80 to HS240	39
Extra Heavy Duty HSG Series HSG 80 to HSG 200	40
Extra Heavy Duty Special H Series	41

## Mini Pitch Chain

Mini Pitch Chain S10, 15 and 25H	42 - 44
----------------------------------	---------

## BS / DIN Roller Chain

BS / DIN Roller Chain 04 to 32B	45
BS / DIN Stainless and Nickel Plated Chain	46
BS / DIN Self Lubricating Chain	47

## Corrosion and Heat Resistance Chain

Corrosion and Heat Resistance Chain	48
ANSI Stainless Roller Chain 15 to 120	49
Stainless Double Pitch Roller Chain C2040 to C2082H	50
Stainless Hollow Pin Chain 40HP to 80HP C2040HP to C2082HP	51
Super Shield Roller Chain	52
Nickel Plated Roller Chain and Low Temperature Chain	53

## Engineering Plastic Chain LEAF Chain

Engineering Plastic Chain	54
Plastic Chain Plamate and Attachment	55
Placurve Chain	56
Straight Running Plastic Chain	57
Plalink Chain	58
Clip Top Chain	59
Double Pitch Plalink and Double Pitch Chain with Plastic Roller	60
Leaf Chain BL and AL Series	61 - 62

## Small Conveyor Chain

Circular Chain (Curved Chain)	63
Double Pitch Conveyor Chain C2040 to C2160H C2042 to C2162H	64
ANSI Roller Chain with Attachment 25 to 160	65
Double Pitch Roller Chain with Attachment	66
ANSI Roller Chain with Extend Pin 35 to 120	67
Double Pitch Roller Chain with Extend Pin C2040 to C2102H	68
ANSI Roller Chain with Wide Contour Attachment	69
Double Pitch Roller Chain with Threaded Hole Attachment	70
ANSI Straight Link Plate Chain and Deep Link Chain	71
Top Roller Chain	72
Roller Chain with Outboard Roller	73
Wide Chain with Cross Rods	74
Hollow Pin Chain	75
Indented Attachments	76
Bai Speed Chain	77
Custom Attachment Chain	78 - 79

## Conveyor Chain

Construction of Conveyor Chain	81
Dimensions of FM,FMH,FE and FEH Standard Conveyor Chain	82 - 83
Attachment A-2,K-2,SA-2 and SK-2	84
Attachment G-2 and G-4	85
Flow Conveyor	86 - 87
Deep Link Conveyor and Outboard Conveyor Chain	88
Apron Conveyor Chain	89
Apron Conveyor and Curve (Sidebow) Conveyor Chain	90

# WARNING

## 1. Attention

All the OCM products are carefully manufactured. However, improper selection, handling or maintenance may result in a serious accident. Please refer to OCM product catalogs and related instructions. If you have any questions, please contact us.

## 2. Warning for handling chains and sprockets

When connecting or disconnecting chain,

- a) Wear safety glasses, gloves, safety shoes and protective clothing suitable for the job.
- b) Support the chain to prevent the uncontrolled movement of chain and parts.
- c) Use proper tools in good condition suitable for connecting and disconnecting chain.
- d) Don't insert or remove pins without knowing their correct direction.
- e) Not only a person being at work but also a person nearby should follow the above instructions.

## 3. Lock out power switch

When installing, dismantling or maintenance servicing like lubricating chain, always lock out power switch to avoid an accident.

## 4. Prevent secondary accident

Always clear around the working area in order to prevent secondary accident.

## 5. To replace parts of chain is dangerous

When replacing worn chain or sprocket, do not attempt to rebuild chains by using parts of disassembled chains. Replace all of them with new ones.

## 6. Reprocessing chain is dangerous

Do not try to reprocess chain. Almost all parts of chain are hardened by heat treatment.

- 1) Plating or some surface treatment of heat treated parts may result in the destruction of chain.
- 2) Do not weld heat treated chain, sprockets and their parts. It may lead to crack them and decrease their strength by heat influence.
- 3) Do not anneal heat treated chain, sprockets and their parts.

## 7. Remove any object interfering with chain and sprocket

Any object interfering with driving chain and sprocket is not only dangerous but make their life span short. Always check and remove the interfering object.

## 8. Lubrication

Constant lubrication prolongs the life of almost all chain. If the chain that need lubrication has been kept long time unlubricated, the life of chain is shorter than expected.

## 9. Washing

When washing chain, don't use any acid, alkali, gasoline and high vaporized solvent. Dip it into kerosine and after that, lubricate it well.

## 10. Aligning shaft and sprockets

To operate the chain normally, sprockets must make a straight line and shafts must be installed and aligned horizontally.

## 11. Build and install chain

- 1) Refer to the item above #1 to 10.
- 2) Connecting link
  - A. Connecting plate
    - a) Loose fit type : It is easy to set the connecting plate into pins.
    - b) Semi-press fit type : Drive connecting plate into pins by hammer.
  - B. Spring clip
    - a) Insert well in right direction.
  - C. Cottered pin
    - a) Do not use the cotter pins on the market. Use only the supplied cotters.
    - b) Install as shown below.

- 3) Do not alter link hole and pin diameter to make them easier fit into chain.
- 4) Do not use any used parts, such as spring clip, cotter pin, connecting plate and so on.
- 5) Check before driving
  - A. Connecting link is connected well and properly.
  - B. Chain engages with teeth of sprockets.
  - C. There is no object interfering and scattering around device.
  - D. Safety cover has been installed.
  - E. There is no object interfering with the chain or the safety cover.
  - F. There is nothing unusual on the connecting link.
  - G. There is no unusual noise.

## 12. Life span of chain and sprocket

Due to the difference of operating environment, condition, teeth of sprocket, status of lubricating and so on, the life span of chains is different even if the chains are the same type and same size. If new chain is used with old sprocket with worn teeth, or if new sprocket is used with old chain that has already been elongated, the life of chain and sprocket gets shorter.

# FEATURES OF OCM ROLLER CHAIN

## 1. Re-Punched Link Holes

OCM's repunching process removes the taper of hole. Both sides of the hole are parallel, better bearing between pins and holes. This process increases fatigue strength.

## 2. Shot-Peening

Rollers and link plates are shot peened to increase fatigue strength.

## 3. Oil Port oriented + Solid Bush

These holes, located on the inner side of the bushings away from bearing area, function as a reservoir for extra lubricant. This feature reduces chain wear and extend the chain's operating life.

## 4. Cylindrical roundness of Solid Bush

The advantage of solid bush, cylindrical roundness, making a large bearing area and oil port as an oil reservoir, improves the chain wear resistance and minimize an initial chain elongation.

## 5. Preloading

OCM roller chain is preloaded automatically after assembly to minimize initial elongation.

# ROLLER CHAIN

## CONSTRUCTION OF ROLLER CHAIN

Roller chain is made up of roller links and pin links.

Roller link consists of two bushings press-fitted into roller link plates with two free rotating rollers over the bushings. Pin link consists of two pin link plates into which two pins are press-fitted.

There are two types of pins. Rivet and cotter types.

## ROLLER CHAIN CONNECTION

### CONNECTING LINKS

**1) Spring clip type**  
This is standard for all single and multiple strand ANSI standard chain, 80 and below and British standard chain, 16B and below.

**3) Offset Link**  
An offset link is a combination of a roller link and a pin link. This link is used where the chain length is an odd number of pitches. It is recommended not to use an offset link whenever possible.

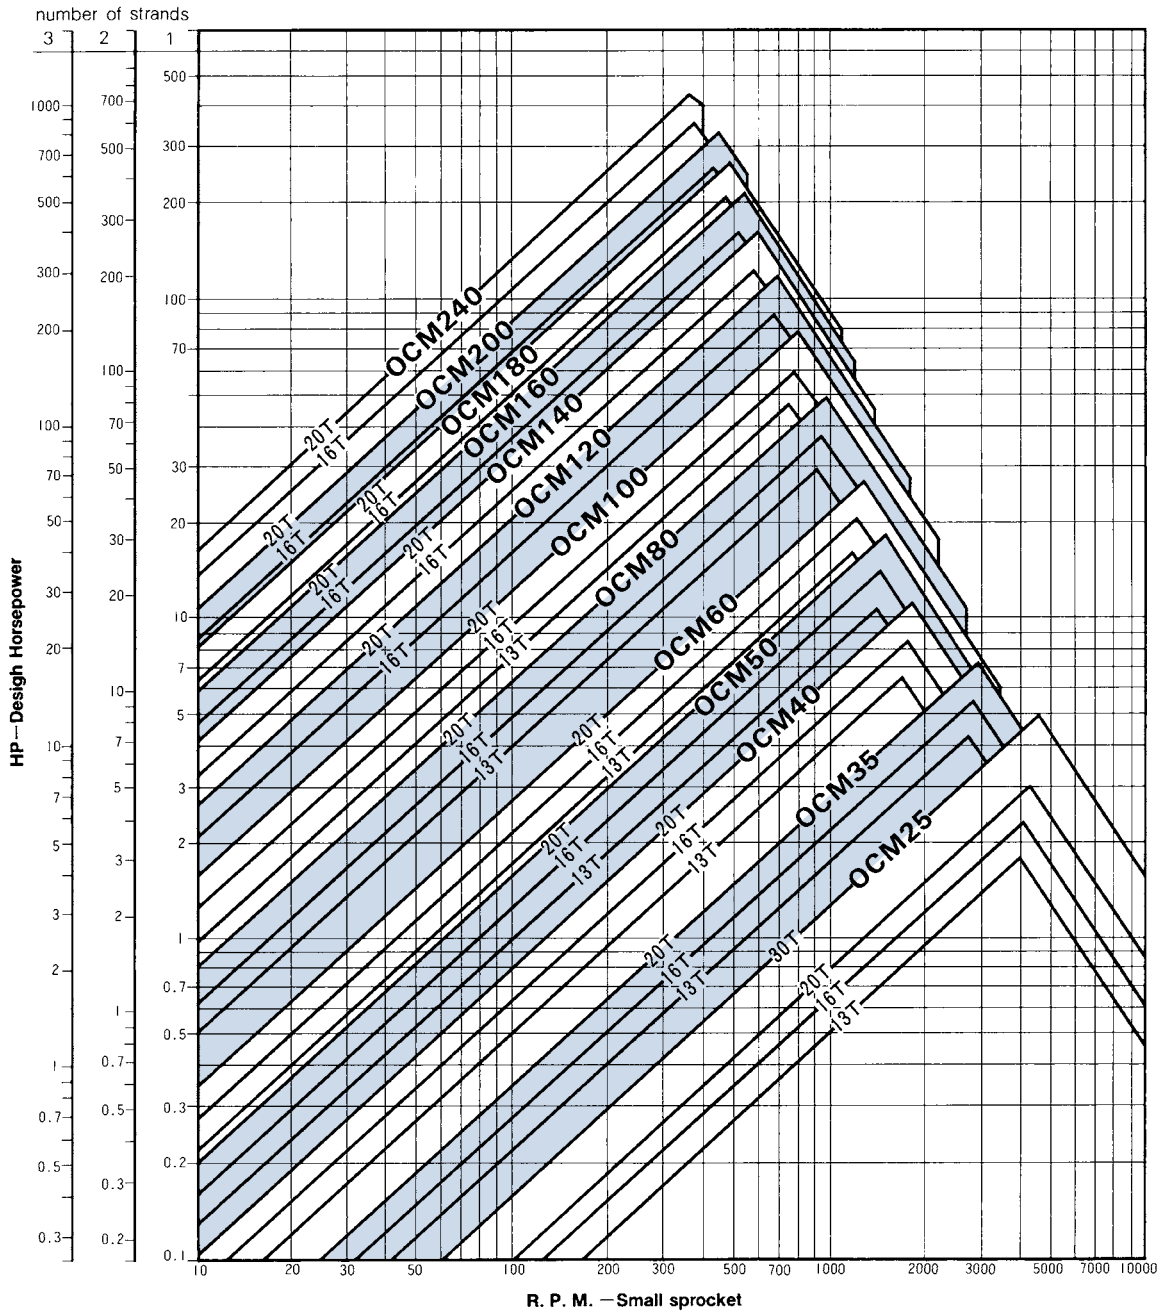

**2) Cotter type**  
This is standard for all single and multiple strand ANSI 100 and above, and British standard 20B and above.

**4) Two Pitch Offset Link**  
The unit consists of one offset and one roller link. Pins are press fitted into the link plates and the unit is more suitable for heavy impact load and high speed driving than one pitch offset link.

# EASY CHAIN SELECTION

Table 1 Easy selection chart

### How to Use Chart

1. The selection of OCM chain can be made by seeking the intersection of RPM of small sprocket (Horizontal line) and design horsepower (Vertical line).

Example:

The rpm of small sprocket is 200, and the design horsepower is 2HP. OCM 50 is obtained and the number of teeth in small sprocket is 13T to 16T.

Example:

The RPM of small sprocket is 600 with design horsepower of 8HP. In this case, OCM 50 and OCM 60 are sought. In case of OCM 50, the

number of teeth is 20T. In the event of OCM 60, the number of teeth is 13T.

After having made a tentative selection based on the chart, refer to the horsepower rating of the tentatively selected chain.

2. If the speed of chain is less than 50M/min., it is sometimes better to use a slow speed selection shown on page 10.

# DRIVE SELECTION PROCEDURE

Procedure for selecting roller chain for transmission

## GENERAL SELECTION

(1) The following information is required for chain selection:

1. Source of power
2. Power to be transmitted
3. Driven Equipment
4. Revolution of drive and driven shaft per minute, and the diameter of the shaft
5. Center distance of the shafts

(2) Determination of service factor

Select a service factor from Table 4 to compensate for the loads imposed on the chain by the type of input power and the type of equipment to be driven.

(3) Establish design horsepower

Multiply the power to be transmitted by the factor obtained from (2)

Single strand:

(A) Design horsepower =  $\frac{\text{The power to be transmitted} \times \text{service factor}}{\text{Multiple stand}}$

Multiple stand:

(B) Design horsepower =  $\frac{\text{The power to be transmitted} \times \text{service factor}}{\text{Multiple strand factor}}$

(4) Determination of number of teeth in small sprocket and roller chain

According to the number of revolutions and designing horsepower of a high speed shaft (in case of low speed, it is a drive shaft. In the event of overdrive, it is a driven shaft), refer to Table 1 Easy Selection Chart and horse power ratings and select an appropriate chain and the number of teeth of small sprocket. When you determine the number of teeth for small sprocket, check the bore capacity of the sprocket selected, making sure it will accommodate the driving shaft.

(5) Determination of number of teeth in the large sprocket

Multiply the drive ratio by the number of teeth in small sprocket.

### Selection Example (1)

Q1. A centrifugal compressor with 3HP is driven by an 1800 rpm electric motor. How to select chain and sprockets.

A1. Seek the service factor, 1.3, from Table 4.

Power to be transmitted  $\times$  Service factor = Design Horsepower  
 $3\text{HP} \times 1.3 = 3.9\text{HP}$

2. Refer to Table 1. Easy selection chart for 1800rpm 3.9HP, and OCM 35 chain with sprocket 16T to 20T is obtained.

3. Check horsepower ratings for chain 35, and as you see, the horsepower ratings of 35 17T with speed of 1800rpm is 3.93HP, which is

satisfactory.

4. The following are selected: Chain No 35  
Small sprocket 35 17T

### Selection Example (2)

Q1. The number of revolutions for drive is 500rpm and the power to be transmitted is 10HP. The rpm is reduced to 125 (1/4). The center distance should be 270mm with a space limitation of 480mm, and a uniform load. How to select chain and sprocket for this application.

A1. Design horsepower is computed as follows:

Design horsepower:  $10\text{HP} \times 1.0 = 10\text{HP}$

2. Select chain and the number of teeth for sprocket by referring to Table 1, Easy selection Chart and horsepower ratings.

OCM 60 18T has been selected.

3. Speed reduction ratio is  $0.25 = \frac{125\text{rpm}}{500\text{rpm}}$

Therefore, the number of teeth in the large

sprocket is  $72T = \frac{18T}{0.25}$

4. The outside diameter of the 18T is 119mm and the 72T is 447mm.

The space required for these arrangements is

$\frac{119+447}{2} + 270 = 553\text{mm}$  which can not be contained in the 480mm.

5. Multiple strand chain is selected.

OCM 50 - 2 16T to 20T is selected using Table 1, Easy Selection Chart. The design horsepower is obtained from the formula (B)

$$\frac{10\text{HP} \times 1.0}{1.7} = 5.88\text{HP}$$

(1.7 is multiple strand factor)

Refer to horsepower ratings. OCM 50 - 2, 18T is obtained. Its outside diameter is 99mm. The

large sprocket is  $72T = \frac{18T}{0.25}$  outside diameter

373mm. However, this selection can not be contained in the space.

6. Triple strand chain is selected in the same manner as above. OCM 50 - 3, 13T and 52T are obtained. The outside diameter of sprockets is 73mm, and 271 mm respectively.

$\frac{73+271}{2} + 270 = 442\text{mm}$  can be contained in the space required.

The chain and sprockets selected are OCM 50 - 3, 13T and 52T.

# SELECTION ON SPECIAL APPLICATIONS

If an application requires the speed of roller chain at less than 50m/min., it is necessary to take into account not wear elongation but fatigue strength. It is, therefore, economical to use a low speed selection method rather than the general selection procedure. For operations under special conditions, a different selection method is required from the general selection procedure.

## (1) Operation at low speeds

The formula below is used if the speed of chain is less than 50M/min. with infrequent starts and stops.

$$\text{Allowable load} \geq \text{Max load imposed on chain} \times \text{Service factor} \times \text{Speed factor}$$

Selection procedure is as follows:

1. Select slightly smaller roller chain and sprocket from a prime mover HP and RPM on Table 1 Easy Selection Chart.
2. Multiply the rpm of sprocket obtained by Table 2, the value of chain speed per one rpm of the sprocket to obtain the speed of chain, m/min.
3. To determine the max load imposed on chain.
4. Service factor from Table 4.
5. Speed factor is obtained from Table 3, speed factor.
6. Using the formula above, calculate the value obtained, and compare the allowable load of a roller chain tentatively selected on the item I above.

If not satisfactory to meet the requirements, please change the chain and sprocket and review.

### Note:

When operation conditions are frequent starts and stops and reversals of drive rotation, increase the service factors to compensate for the conditions or consult OCM.

## (2) Operations under abnormal atmosphere conditions

If the atmosphere condition of operation is worse than ordinary, consult OCM. If operation atmosphere is high temperature or corrosive, it is recommended to use stainless steel roller chain.

**Table 3 Speed Factor**

Speed of Roller chain (m/min)	Speed Factor	Remarks
<b>Less than 10</b>	1.0	
<b>10 and Less than 20</b>	1.1	
<b>20 and Less than 30</b>	1.2	
<b>30 and Less than 40</b>	1.3	
<b>40 and Less than 50</b>	1.4	
<b>50 and Less than 70</b>	1.6	Applicable only to OCM Stainless Roller Chain

# HORSEPOWER RATINGS TABLE

Horsepower ratings tables on the catalog are based on the following :

- (1) Under normal atmosphere conditions
- (2) Power transmission by single strand chain
- (3) Service factor of Table 4 is 1.0
- (4) Lubrication is appropriate.
- (5) Two shafts to transmit power is horizontal, properly located and installed.
- (6) Load variation is small.

To compensate for the loads imposed on the chain by the type of input power and the type of equipment to be driven, the selection of an appropriate service factor is required.

For multiple strand chains, apply a factor of multiple strand factor Table 5.

**Table 4 Service Factor**

Basis for service factor	Driven equipment	Service Factor		
		Electric motor or turbine	Internal combustion Engine with hydraulic drive	Internal combustion Engine without hydraulic drive
Uniform load	Agitators, liquid stock centrifugal blowers, generators, centrifugal pumps, conveyor or elevator uniformly loaded, machinery uniform load and non-reversing.	1.0	1.0	1.2
Mild (Moderate) shock load	Centrifugal compressor, kilns and dryers, conveyor and elevator with mild shock load, machinery with moderate pulsating.	1.3	1.2	1.4
Heavy shock load	Reciprocating compressor, crushers, reciprocating feeder, machinery with severe load or reversing.	1.5	1.4	1.7

Note: 1. Appropriate lubricant and lubrication should be used. See page 15. The surrounding temperature of -10°C to 60°C is considered normal.  
 2. When the surrounding temperature is less than -40°C, use refrigerating machine oil and multiply the service factor above by 2.0.

**Table 5 Multiple Strand Factors**

Number of strands	Multiple strand factors
2	1.7
3	2.5
4	3.3
5	3.9
6	4.6

### Chain Pitch

Use the smallest pitch chain that will meet requirements. If single strand chains can not satisfy requirements, use small pitch multiple strand chains. If the center distance should be short and the outside diameter of sprockets be small because of space restrictions, use multiple strand chains and sprockets with large number of teeth.

### Number of Teeth for Small Sprockets

The recommended number of teeth for small sprockets is not less than 17 for a quieter drive with less impact.

However, a sprocket with number of around 11 teeth can be used at a slow speed while at a high speed, the recommended number of teeth is not less than 25.

### Hardened Teeth

It is advisable to harden sprockets under the following operating conditions:

- SLOW SPEED AND HEAVILY LOADED DRIVES
- HIGH SPEED DRIVES
- LARGE RATIO DRIVES
- ABRASIVE OR CORROSIVE CONDITIONS

OCM ANSI 35 to 100 B type sprockets are induction hardened.

### Teeth of Large Sprockets

As the joint-wear of a roller chain progresses, it tends to jump or ride over the teeth of a sprocket. Chain life based on the joint-wear varies according to the number of teeth in large sprockets as shown in chart below.

Generally, the wear life of a roller chain is when the elongation per pitch is in the range of 2 - 3%. In this case, the number of teeth in large sprockets is 40 through 60.

### Minimum Chain Wrap and Drive Ratio

The suggested minimum chain wrap on the small sprocket is not less than 120° to obtain smooth transmission (satisfactory operation). It is recommended therefore that the speed ratio for a single reduction drive be held not to exceed 1:7. If a large speed ratio is required, double reduction drive should be used.

**Sprocket Bore Diameter**

Make sure the bore capacity of the sprocket selected will accommodate the shaft. If the sprocket selected does not accommodate the shaft, select a different number of teeth. If you can not change the number of teeth in the sprocket, review the shaft dia. and max. bore. The max bore is obtained using the formula.

$$\text{Max. bore} = P \left( \cot \frac{180}{N} - 1 \right) - 0.76$$

P = Chain pitch N = Number of teeth

**Variation in Chain Speed due to Chordal Action**

A roller chain that engages a sprocket forms a polygon. The ( position ) chain rises and falls, and a variation in chain speed occurs. The greater the number of teeth, the less will be the speed variation. The speed variation is reduced as the number of teeth on a small sprocket increases. A less speed variation is obtained as the number of teeth exceeds 25 as shown below.

**Service Factor**

For normal transmission, service factor Table 4 is used. However, under the following operating conditions, increase the service factors for better transmission.

- Frequent starts and stops
- Insufficient lubrication
- Shaft center distance is short
- A drive arrangement is vertical with a small sprocket located below
- Driven sprockets are more than two
- Reversing
- Load periodically varies

**Number of Links of Chain and Connecting Link**

We recommend that you use a chain length with an even number of pitches in order not to use an offset link. For low speed as shown in page 11 on low speed chain selection, we suggest chain endless is used without the use of a connecting or offset link. The fatigue strength (allowable load) of a connecting link and an offset link is lower than that of plain chain.

**Length of Chain**

If the type of chain and sprockets are determined on the basis of the selection method of roller chain drives and the shaft center distance is decided, the required length of chain is computed using the following formula and Table K factors.

$$L = \frac{N+n}{2} + 2C + \frac{K}{C}$$

L = CHAIN LENGTH, PITCHES  
 N = NUMBER OF TEETH IN LARGE SPROCKET  
 n = NUMBER OF TEETH IN SMALL SPROCKET  
 C = SHAFT CENTER, PITCHES  
 K = DETERMINE THE VALUE N-n, AND OBTAIN K FROM TABLE 6 K FACTORS

The number of pitches is obtained by omitting fractions. When L is an odd number, an offset link is required. We recommend that you avoid using an offset link. When possible, an even number of pitches by changing the shaft center distance or number of teeth on the sprocket is used.

**Shaft Center Distance**

If the length of chain and the number of teeth in the sprockets have already been determined, the shaft center distance is calculated using the following formula:

$$C = \frac{1}{8} \left\{ 2L - N - n + \sqrt{(2L - N - n)^2 - 0.811(N - n)^2} \right\}$$

C is Number of pitches

**Chain Speed and Load on Chain**

1. Chain speed is easily obtained from Table 2 chain speed per one rpm of sprocket.

The number of teeth on sprockets other than those on the Table 2 is obtained using the following formula:

$$V = \frac{P \cdot N \cdot n}{1,000} \text{ (m/min.)}$$

V = CHAIN SPEED ( M/MIN)  
 P = CHAIN PITCH ( MM)  
 N = NUMBER OF TEETH IN SPROCKET  
 n = RPM OF SPROCKET

2. Load on chain is found by the following formula:

$$F = \frac{4.567HP}{V} \text{ (kg)}$$

F = Load on chain (kg)  
 V = Chain speed (m/min.)

Note : In case of starts and braking of an electric motor, inertia takes place, and a larger load than the normal output horsepower of the motor may impose on chain.

Table 6 Factors K

N-n	K	N-n	K	N-n	K	N-n	K	N-n	K	N-n	K	N-n	K	N-n	K	N-n	K	N-n	K

**Installation and Arrangement**

The arrangements A, B and C are preferred, and will operate satisfactorily in either direction. If the least recommended arrangements are necessary due to application realities, chain tensioners or some other means are required. In case a shaft center distance is short, the frequency of chain rotations increases and the chain is inclined to elongate faster. In general, a preferred center distance is 30 to 50 times chain pitches. A minimum center distance should be sufficient to give clearance between the teeth of the two sprockets. The minimum center distance should be not less than the diameter of the large sprocket plus one half the diameter of the small sprocket.

**Prevention of Chain Vibration**

If a vibration takes place due to transmission conditions, please install a guide.

**Chain Sag**

The amount of chain sag (SS') is generally 4% of the span. The sag should be 2% of the span for the following applications:

- (1) Drive arrangements are vertical or similar.
- (2) Heavy load and frequent starts.
- (3) Shaft center distance is more than one meter.
- (4) Travel direction of chain is often reversed.

In case chain elongates, the center distance is adjusted by moving one shaft. It is convenient, therefore, that one shaft is made movable from the center distance by two percent.

**Aligning Shafts and Sprockets**

The distance D of two shafts should be the same and the two shafts should be aligned horizontally. Apply a straight edge to the sprocket surfaces to see if two sprockets are in the same plane.

## LUBRICATION

The long service life of chain depends highly on lubrication. An optimum lubrication is an important factor in obtaining a desired life of chain. Please use the lubrication types as shown in the Horsepower ratings table.

### Application of lubricant to chains

Apply oil as shown so that oil will arrive at bearing surfaces of chain and an oil film will be maintained among the pin, bushing and roller. The amount of wear is reduced and the life of chain is prolonged.

### Selection of the lubricant

Use only high quality oil. The lubricants suggested for specific temperature ranges are shown in the following selection table.

### Selection Table (Viscosity)

SURROUNDING TEMPERATURE C		SAE VISCOSITY NUMBER
-10°C	THRU 0°C	SAE 20
0°C	THRU 40°C	30
40°C	THRU 50°C	40
50°C	THRU 60°C	50

Note:

- (1) For manual lubrication, if oil drips from chain, use a high viscosity lubricant.
- (2) If the surrounding temperature is less than -10°C it is recommended to use refrigerating machine oil.
- (3) If the surrounding temperature is not less than 60, please consult us.

### Type of Lubrication

I		<p><b>Manual lubrication</b></p> <p>Oil is applied with a brush or oil can. Every 4 to 8 hours, the oil should be applied to between link plates in the lower span of the chain.</p>
		<p><b>Drip feed lubrication</b></p> <p>A simple casing is required. About twenty drops of oil per minute are distributed from a drip lubricator between the link plates.</p>
II		<p><b>Oil bath lubrication</b></p> <p>A leak-proof casing is required. The chain dips into an oil reservoir. The sprockets should dip into the oil one half inch. If the sprocket dips too deep, heat is generated.</p>
		<p><b>Disc lubrication</b></p> <p>A leak proof casing is required. The chain operates above the oil level. The disc should dip into the oil one half to one inch.</p>
III		<p><b>Pump lubrication</b></p> <p>A leak proof casing is required. The oil is circulated with a pump and the oil should be cooled.</p>

Chain drives should be inspected at intervals to assure that the lubrication is functioning properly. If the chain and bushing is discolored, grooved or galled, the chain will not be sufficiently lubricated. For better lubrication, inspect the chain after it is periodically removed and washed with kerosine.

# OCM ROLLER CHAIN

## OSB SERIES ROLLER CHAIN

OCM introduces, OSB Series, oil port oriented solid bush roller chain with solid roller. Over 30 years' experience of manufacturing oil port roller chain made this possible. It incorporates the advantage of solid bush, cylindrical roundness, making a large bearing area and oil port as oil reservoir. The large bearing area and oil port, acting as an oil reservoir, improve the wear resistance and prolong the chain life by 30% as compared with solid bush chain without oil port under no lubricating condition.

----- Split bush without oil port    ——— Solid bush without oil port    ——— Solid bush with oil port

Data are based on OCM's test.

Connecting link for 40 through 60 is spring clip. Spring clip and cotter for 80 are available. Cotter type for 100 through 240.  
\*Indicates roller chain with solid bush but without oil port.

Remarks) 1. For HP rating of multiple strand, multiply the HP above by multiple strand factor shown in the table at right.  
2. The operation in right part of the dotted line is not recommended.  
3. The lubrication type is as follows. Type I : Manual & Drip feed, Type II : Oil bath and Disc, Type III : Pump  
4. Dimensions & Ratings are subject to change without notice. Certified dimensions furnished upon request.

Number of Strands	2	3	4	5	6
Multiple Strand Factors	1.7	2.5	3.3	3.9	4.6

# ANSI ROLLER CHAIN HEAVY SERIES

Heavy Series differs from standard roller chain in link plate thickness. All the others are identical. There is no increase in tensile strength, but the thick link plate helps withstand abnormal shock loads.

# DOUBLE PITCH ROLLER CHAIN

This chain is more economical than standard roller chain and well suited for applications where shaft centers are long. Stainless steel chain is available.

1. Spring clip type is standard for connecting links of 2040 through 2060 and cotter for 2080 and above.  
Note: Dimensions subject to change. Certified dimensions furnished upon request.

# OCM SELUBE CHAIN

**OCM SELUBE chains provide excellent wear life without lubrication as much as 8 to 30 times better than standard roller chain.**

SELUBE chain is made up of sintered metal bushings impregnated with high quality oil and plated pins. As SELUBE chain does not require lubrication, it is suitable for applications where lubrication is not possible or practical. All major dimensions are the same as standard roller chain.

SELUBE chain can immediately replace standard ANSI roller chain. The operating temperature should be within a range of -10°C (14°F) to 150°C (300°F). The chain operating speed should be kept below 150m (490feet) per minute.

SEB type SELUBE chain has the same maximum allowable load guidelines as standard roller chain. This chain has shouldered sintered bushings with heavy link plates. As compared with SER type, the bushings of SEB are larger and more oil impregnated. SEB type can last longer than SER without lubrication. This chain can operate on standard sprockets.

SEB

SER type SELUBE chain has the same maximum allowable load guidelines as standard roller chain. This chain has straight bushings with rollers and heavy roller link plates.

SER type chain offers smooth engagement with the sprocket. This chain can operate on standard sprockets.

SER

SELUBE small conveyor chain has straight sintered bushings impregnated with high quality oil and strong rollers.

This chain can replace standard conveyor chain and operate on standard sprockets.

The strength of SELUBE small conveyor is lower than that of SER, SEB and standard steel chain.

### CHAIN SELECTION

The selection procedure is the same as that for standard roller chain.

But note the following :

- (1) Operating temperature should be within a range of -10°C (14°F) to +150°C (300°F).
- (2) Chain should not be exposed to water and deoiling atmosphere.

The specifications described in this catalogue are subject to change without notice

# OCM EXTRA HEAVY DUTY ROLLER CHAIN

## EXTRA HEAVY DUTY ROLLER CHAIN

For tough applications, please consider using **OCM Extra Heavy Duty Roller Chain, HS Series, HSG Series and Special H Series roller chain.**

This strength is made possible by the following extra processes:

**Ball through**

**Shot peening**

**Perfect lubrication**

Chain is prelubricated at a vacuum where air pockets are eliminated to help lubricant penetrate all bearing areas.

**Four stakes riveted**

TENSILE STRENGTH		WORKING LOAD	
HSG SERIES	118	HSG SERIES	125
HS SERIES	110	HS SERIES	120
OCM ANSI STANDARD	100	OCM ANSI STANDARD	100

**HS Series roller chain**

The main dimensions are identical to those of ANSI standard roller chain. HS Series roller chain can operate on standard sprockets. No offset is available. Connecting links are press fitted. S pin connecting link for 80 through 120 and Cotter for 140 through 240 are standard.

**HSG Series roller chain**

The thickness of link plate is thicker than standard roller chain.

**Special H Series**

Chain is developed for tough machinery and applications.

▲ indicates bush diameter. ■ indicates straight link plate.  
Most of chain is used endless. No connecting is available except some sizes.

EXTRA HEAVY DUTY ROLLER CHAIN

# OCM MINI PITCH CHAIN

OCM mini pitch chain has a long standing reputation for its high precision and reliability. The chain is widely used in a positive and precision drive and control. OCM S10, the world's smallest chain, is used in various types of medical instruments.

## OCM MINI CHAIN

Chain No. **S10** Pitch • 0.125inch / 3.175mm

UNIT Upper:inch  
Beneath:mm

OCM Chain No.	Pitch	Roller Diam.	Width between L.P.	Link Plate		Pin Diam.	Pin			Average Tensile Strength	Approx Weight
	P	D	W	H	T	d	L	L1	L2	Lb/kg	Lb/ft kg/m

t is pin link plate thickness.

# BS/DIN SELUBE CHAIN

OCM SELUBE CHAIN, being self-lubricating, provides excellent wear life, 8 to 30 times better than standard roller chain. ANSI and BS/DIN SELUBE CHAINS are available. SELUBE CHAIN is interchangeable with ANSI and BS/DIN standard roller chain. To prevent corrosion, pins are nickel plated and link plates are blackened.

Operating temperature within a range of -10°C (14°F) to 150°C (302°F)  
 Operating speed to be kept below 150m (490 feet) per minute

**Advantages**

- SELUBE CHAIN can be used where lubrication is prohibited or products should not be contaminated.
- No lubrication makes environment clean.
- Maintenance costs are reduced.
- Strength is almost the same as that of standard roller chain.
- Heat resistance up to 150°C.

Blackened Link Plate    Nickel Plated Pin

## STAINLESS ROLLER CHAIN

### 1. Stainless Roller Chain SUS Series

This chain is made of 304 (austenitic) stainless steel. This chain has excellent corrosive resistance and very low magnetic permeability.

This chain is good for general acid, alkali and water. Heat resistance.

### 2. Stainless Roller Chain SAC Series

This chain is made of 316 (austenitic) stainless steel. This is better in corrosion resistance than SUS Series and non-magnetic. Spring clips and cotters used are made of 304 stainless steel. Heat resistance.

### 3. Stainless Roller Chain SPH Series

The pin, bush and roller of this chain are made of 600 Series precipitation hardened stainless steel with link plate of 304 stainless steel. Spring clips and cotters used are made of 304 stainless steel. Magnetic.

Better wear resistance. The working load of this chain is 1.5 times SUS Series.

### 4. Super Shield Chain

A tough protective coating is baked onto the chain. This chain is better than nickel plated chain in corrosion resistance. The tensile strength is slightly lower than standard roller chain. Please avoid using this chain for the applications requiring resistance to acids and in direct contact with food. When you need a chain for corrosion resistance to salt water, rain water, etc, use SUPER SHIELD.

### 5. Nickel Plated Chain

Assembled from special nickel plated components. This chain with good corrosion resistance and beautiful surface appearance is used for food machinery, office machinery, etc.

### 6. Cold Resistance Chain K Series

This chain is identical in dimension with standard roller chain but can be used at a temperature of  $-30^{\circ}\text{C}$ ~ $60^{\circ}\text{C}$ .

# SUPER SHIELD CHAIN

SUPER SHIELD CHAIN by OCM is a corrosion resistant chain for areas exposed directly to water. Second only to OCM's stainless steel roller chain in corrosion resistance, SUPER SHIELD CHAIN also retains almost the strength of standard roller chain.

A tough protective coating is baked onto the chain, providing corrosion resistance up to 250°C. When you need a chain for corrosion resistance to salt water, rain water, etc., use SUPER SHIELD CHAIN.

When addressing contact with food or other applications requiring resistance to acids, use OCM's stainless steel roller chain products.

Test Result – See the pictures shown on the right –

Chain was sprayed with salt water. The test was made in accordance with JIS Z2371, Japan Industrial Standard.

- (1) OCM SUPER SHIELD CHAIN
- (2) Competitor's Equivalent
- (3) OCM Nickel Plated Chain

Chain after 72 hours elapsed

Chain after 504 hours elapsed

# NICKEL PLATED ROLLER CHAIN

OCM nickel plated chains provide stronger corrosion resistance than steel chains at low cost. Nickel plate prior to assembly or after assembly is available.

Plating is available for ANSI 25 through 200 and double pitch roller chains.

# CHAIN FOR LOW TEMPERATURE

This chain is built for a temperature of -30°C(-22°F) to 60°C(140°F).

The chain is dimensionally the same as ANSI standard roller chain.

# OCM PLASTIC CHAIN

## PLAMATE CHAIN

Plamate chain is made up of plastic roller link with either stainless link plate and pin (PS) or nickel plated link plate and pin (PN).

No lubrication, clean and light in weight.

Usable in temperature up to 70°C from -10°C. The max chain speed should be less than 70m/min. No offset is available. Use even number of pitches.

Plamate can operate on ANSI standard sprockets.

TYPE PN & PS

Attachment is placed only on outside link.

# PLACURVE CHAIN

Placurve chain, made of plastic and stainless steel pin, can sideflex.  
 No lubrication, light in weight, clean and less noise.  
 Suitable for conveying bottles, paper bags, small products, food processing.  
 Chain can operate on ANSI standard sprockets.  
 Operatable temperature: -10°C~70°C  
 Chain speed should be less than 60M/min.  
 Material: Polyacetal  
 PC40S-20 has no wing and is for straight line running.

# PLALINK CHAIN

Stainless or steel outside link plates are molded together with plastic. It looks like outside link plates coated with plastic. Plalink Chain is developed to convey materials on the top of outside link plates.

As Plalink has the advantage of steel strength and plastic lower friction, it is suitable for conveying carton boxes, plastic pallets and products the surface of which should not be damaged. Materials to be conveyed can be accumulated and stopped momentarily.

It is especially suitable for applications where the strength of plastic is insufficient, the advantage of plastic smoothness and low noise are required.

Type of Chain	Chain No.
Nickel Plated Chain: N	PLK40N
Stainless Steel Chain: SUS	PLK40SUS
Steel Selflube Chain: SER	PLK40N-SER

Usable temperature: -10°C to 70°C  
 Max chain speed: 30m/min and below.  
 Recommended 15m/min. and below  
 Sprockets: The minimum number of teeth is 13.  
 Plastic color: white and black.

If chain may interfere with the hub of sprockets, "C" dimension should be as shown above.

# CT TYPE CLIP TOP CHAIN

Plastic tops are snapped on extended pins of chain. The chain is enclosed with plastic tops. As there is no opening on plastic tops, it makes foreign objects difficult to go into between plastic tops.

Clip top chain is well suitable for applications where the strength of steel chain and the smooth surface of plastic are required, making it possible to convey heavy loads and prevent materials to be conveyed from damaging.

Carbon steel chain : CT-30-A

Nickel plated carbon steel chain : CT40N-U

Stainless steel chain (SUS304) : CT40SUS-E

Selflube steel chain : CT60SER-A

Type of plastic top :

A : Polyacetal (White) for general conveyance

U : Polyurethane (semi transparent) for slip-resistant conveyance

E : Electro conductive polyamide for preventing materials to be conveyed from electrification.

Usable temperature : -10°C to 70°C

(Polyurethane : -10°C to 50°C)

Max chain speed : 30m/min.

(Recommend : 15m/min and slower)

Minimum number of teeth of sprockets : 13

# DOUBLE PITCH PLALINK CHAIN

Plalink chain is made up of each outside link with plastic plate and carbon steel plate. Smoothness of plastic prevents products conveyed from being damaged. Carbon steel plates keep a steel strength.

# OCM SMALL CONVEYOR CHAIN

## CIRCULAR CHAIN

The chain is an extra clearance chain to permit side flexing and twisting. It is designed for curved conveyor application. The chain is made of the same material to ANSI standard roller chain, and operate on ANSI standard sprockets.

Weight is for top roller every link. Special sprockets are required for large roller chain. Supplied on a made to order basis.

# ROLLER CHAIN WITH OUTBOARD ROLLER

Standard roller chain with outboard roller. Outboard roller is made of poly acetal.  
 Quiet and smooth operation. Specify spacing of outboard roller when ordering.

# APPLICATIONS FOR CUSTOM ATTACHMENT CHAIN

The chains shown are examples specially designed to meet users' requirements. A wide variety of custom attachment chain is manufactured daily. Please contact OCM for any question and quotation.

Conveying equipment

Conveying resistors, welding rods, etc.

Conveying resistors, welding rods, etc.

Conveying resistors, welding rods, etc.

For shutter opening and closing

Binder for agricultural machine

Conveying equipment

Skylight opening and closing

For agricultural machine

Conveying pallets

Conveying pallets

Conveying foods

Conveying foods

Conveying for food machinery

Conveying noodle

Clipping chain for clipping film

Clipping chain for clipping film

For shutter closing and opening

For shutter closing and opening

For conveying pallets

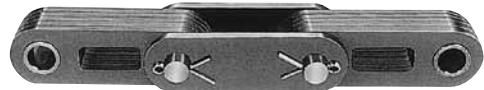

For conveying logs

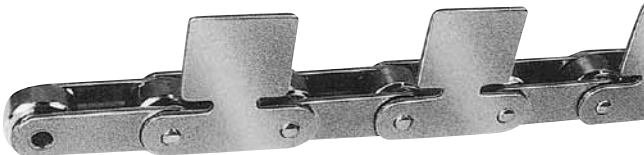

For conveying medical instruments

For conveying foamed styrol

For construction machinery

Conveying machinery parts

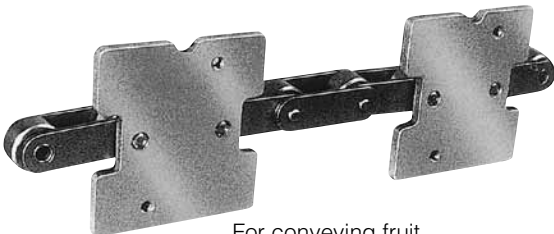

For curved conveyance

For conveying pallets

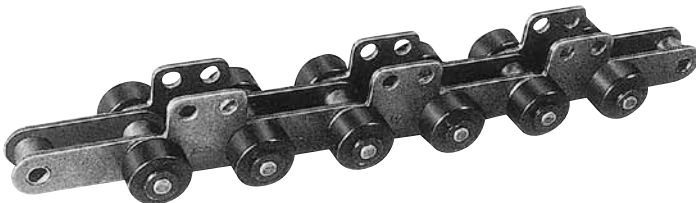

Paper conveyance

For conveying fruit

Trolley conveyor

For pallet conveying line

Fish conveyance

Conveying machinery parts

Fish conveyance

# CUTTING AND CONNECTING OF CHAIN

To cut and connect chain, chain anvil and punches with hammer are used.

Punches and chain anvil

## Cutting

No.1  
As to rivet type chain, grind the end of two pins.

No.2  
As to cotter chain, pull cotter keys out.

No.3  
Place the chain on suitable holes of the chain anvil. Put a punch on two pins and hammer them alternately and equally to push them out.

## Connecting

Wind the chain on sprocket and put two pins of connecting link into bushes of the chain.

Insert the plate of connecting link and put spring clip or cotter keys to hold it.

Spring clip should be inserted with its opening opposite the chain running direction.

T pin should be bent 30 degrees, Cotter keys 60 degrees and S pins 30 degrees as shown above.

# OCM CONVEYOR CHAIN

## CONVEYOR CHAIN

### CONSTRUCTION OF CONVEYOR CHAIN

There are many types of chains for conveyor applications, but steel conveyor chains are popular and widely used. OCM FM and FE type conveyor chains are superior to other types in strength,

wear- resistance and the characteristics that changes in material and attachment are readily made according to an application.

### CONVEYOR TYPE BY ROLLER

#### 1. R Roller

The outside diameter of roller is larger than the height of link plate. This type of conveyor is used mainly for slat, pallet, flight conveyors, etc.

#### 2. F Roller

Flanged roller. This type is widely used on slat, inclined bucket and pan conveyors.

#### 3. S Roller

The outside diameter of roller is smaller than the height of link plate. This is used for bucket elevator and flow conveyors.

### STANDARD ATTACHMENT

Attachments are attached according to requirements. The following three basic types are standard.

#### 1. Type A

A-1 indicates one hole. A-2 two holes.

#### 2. Type K

K-1 indicates one hole. K-2 two holes.

#### 3. Type G

G-2 indicates two holes. G-4 four holes.

# FLOW CONVEYOR CHAIN

The chains are ideal for preventing environmental pollution because they convey powdered material and grain in sealed case.

# APRON CONVEYOR CHAIN

This OCM apron conveyor is ideal for conveying bulk material such as chips made by machine tools.

## Main features

- 1 ) Excellent for conveying small bulk material.  
Each apron plate is closely connected by hinges.  
Even tiny particle such as sand are easily conveyed.
- 2 ) Side chains are OCM standard conveyor chain.  
OCM standard sprocket can be used.
- 3 ) Specifications can be changed according to applications.
  - (1) Aprons are partitioned with plates, and different materials without mixing can be conveyed.
  - (2) For sharp inclined conveyor, stop plates are available.  
The stop plate can be installed at any desired pitch.
  - (3) For drying and freezing parts or material, small holed aprons are available.
  - (4) Stainless apron is available.
